

What We Can Learn from Jury Note Taking: A Content Analysis

Emily Denne, Emily Line, Jake Plantz,
Elizabeth Mathers, and Tess M.S. Neal

Funded by NSF Grant #1739981

Jury Note Taking

- Memory aid vs. distraction
- What are jurors writing about
- Dann, Hans, and Kaye (2005)

88% took notes

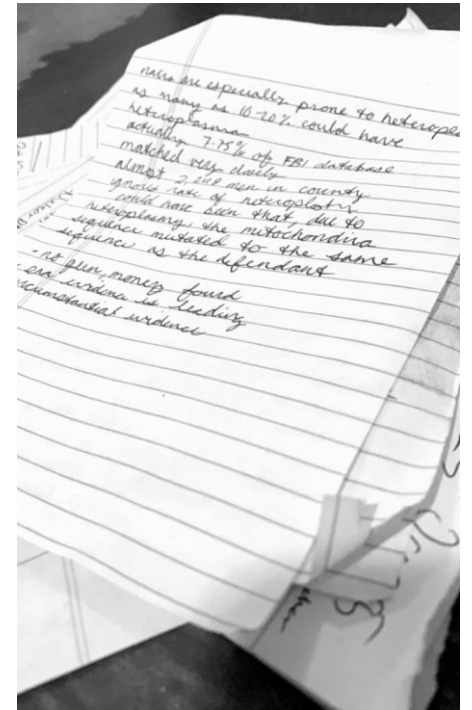

270 words

89% rated notes
favorably

Jury Note Taking

- Memory is fallible
- Notetaking can enhance encoding and retrieval
- How are jurors remembering and applying case evidence?
 - Notes provide an insight

Aim of the Present Study

- What information are jurors writing about?
- What do they think is important?
- Content analysis
 - Simple vs. Complex evidence
 - Gist vs. Specific information

Fuzzy Trace Theory

- Reyna & Brainerd, 1995
- Gist vs. Verbatim representation

Gist

- gloves
- gun
- sweater

VS

Verbatim

- Green leather gloves worth \$80
- .38 Caliber Smith & Wesson Revolver
- Blue Adidas sweatshirt with a small white logo on front right side

Present Study

- 45-minute mock bank robbery trial
- Evidence: defendant testimony, witness testimony, prosecution expert witness, defense expert witness
 - Expert witnesses: complex DNA evidence
- $n_{\text{notes}} = 94$
- $n_{\text{lines}} = 4705$ ($M_{\text{per person}} = 50.06$, $SD = 27.36$)
- $M_{\text{words}} = 176.50$

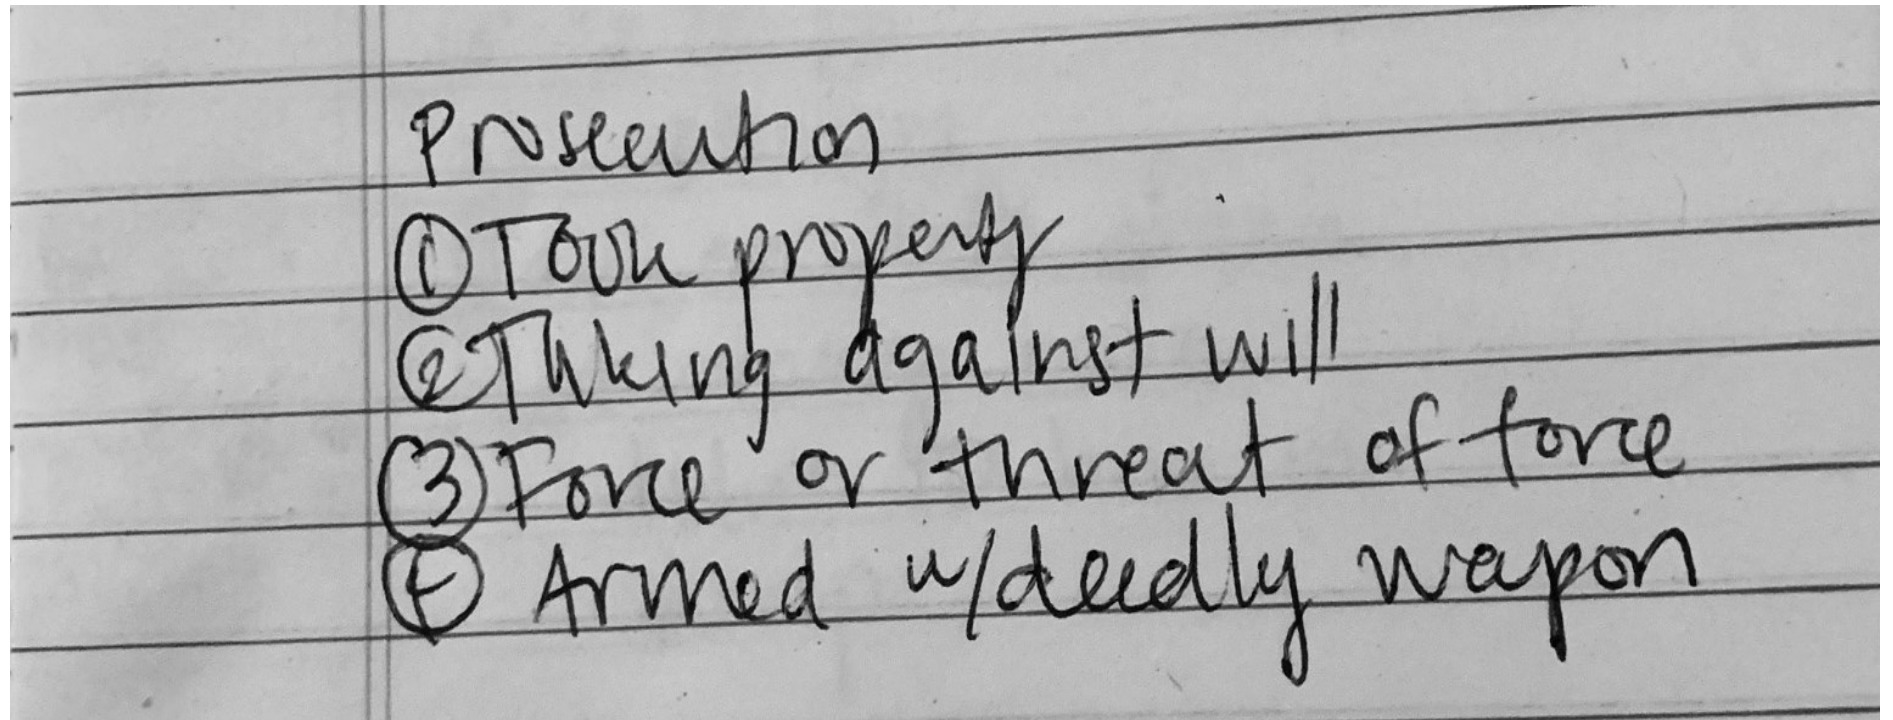

Coding Guide

- Jury instructions
- Gist vs Specific
- General Evidence vs Expert Evidence
 - General Evidence: gun, sweater, money, scar
 - Expert Evidence: DNA evidence
- Expert Evidence Related To?
- Expert Evidence Reliability?
- Kappas: .87-1.00

Jury Instructions

- N jurors = 66 (70%)
 - Dann, Hans, and Kaye (2005) – 85%

Gist information vs. Specific information

- Gist = 1115 (65%)
 - “Rare, hasn’t been observed”

- Specific = 600 (35%)
 - “6’, 270 lb, 30-35 yrs”

GIST

DNA

- defendant's hair
- mitochondrial DNA match
- ↳ identical
- ↳ rare hasn't been observed
- Not heteroplasmic

*not
likely
can be
excluded

SPECIFIC

Kathlene Blessing - teller

Avg height/build

6', 270 lb

30 - 35 yrs

Scar on left cheek

Not very sure

- didn't ID him in lineup

he look
older?

pretty
noticeable/
characteristic
scar

Gist information vs. Specific information

- Gist = 1115 (65%)
 - “Rare hasn’t been observed”
 - General evidence = 421 (37.8%)
 - Complex evidence = 690 (61.9%)
- Specific = 600 (35%)
 - “6’, 270 lb, 30-35 yrs”
 - General evidence = 329 (54.9%)
 - Complex evidence = 270 (45.1%)

GIST

DNA

- defendant's hair
- mitochondrial DNA match
- ↳ identical
- ↳ rare hasn't been observed
- Not heteroplasmic

*what
could
be
excluded

SPECIFIC

Kathlene Blessing - teller

Avg height/build

6', 270 lb

30 - 35 yrs

Scar on left cheek

Not very sure

- didn't ID him in lineup

he look
older?

pretty
noticeable/
characteristic
scar

Content of DNA mention

- General characteristics of DNA
- DNA match process
- Heteroplasmy
- Database size

Example: DNA Match Process

Rare DNA found from hair
Defendant matches hair DNA
DNA sequence had to match defendant
Chance of brother committing crime
Persons of paternal line could
share Rare DNA

Rare DNA found from hair
DNA sequence had to match
defendant

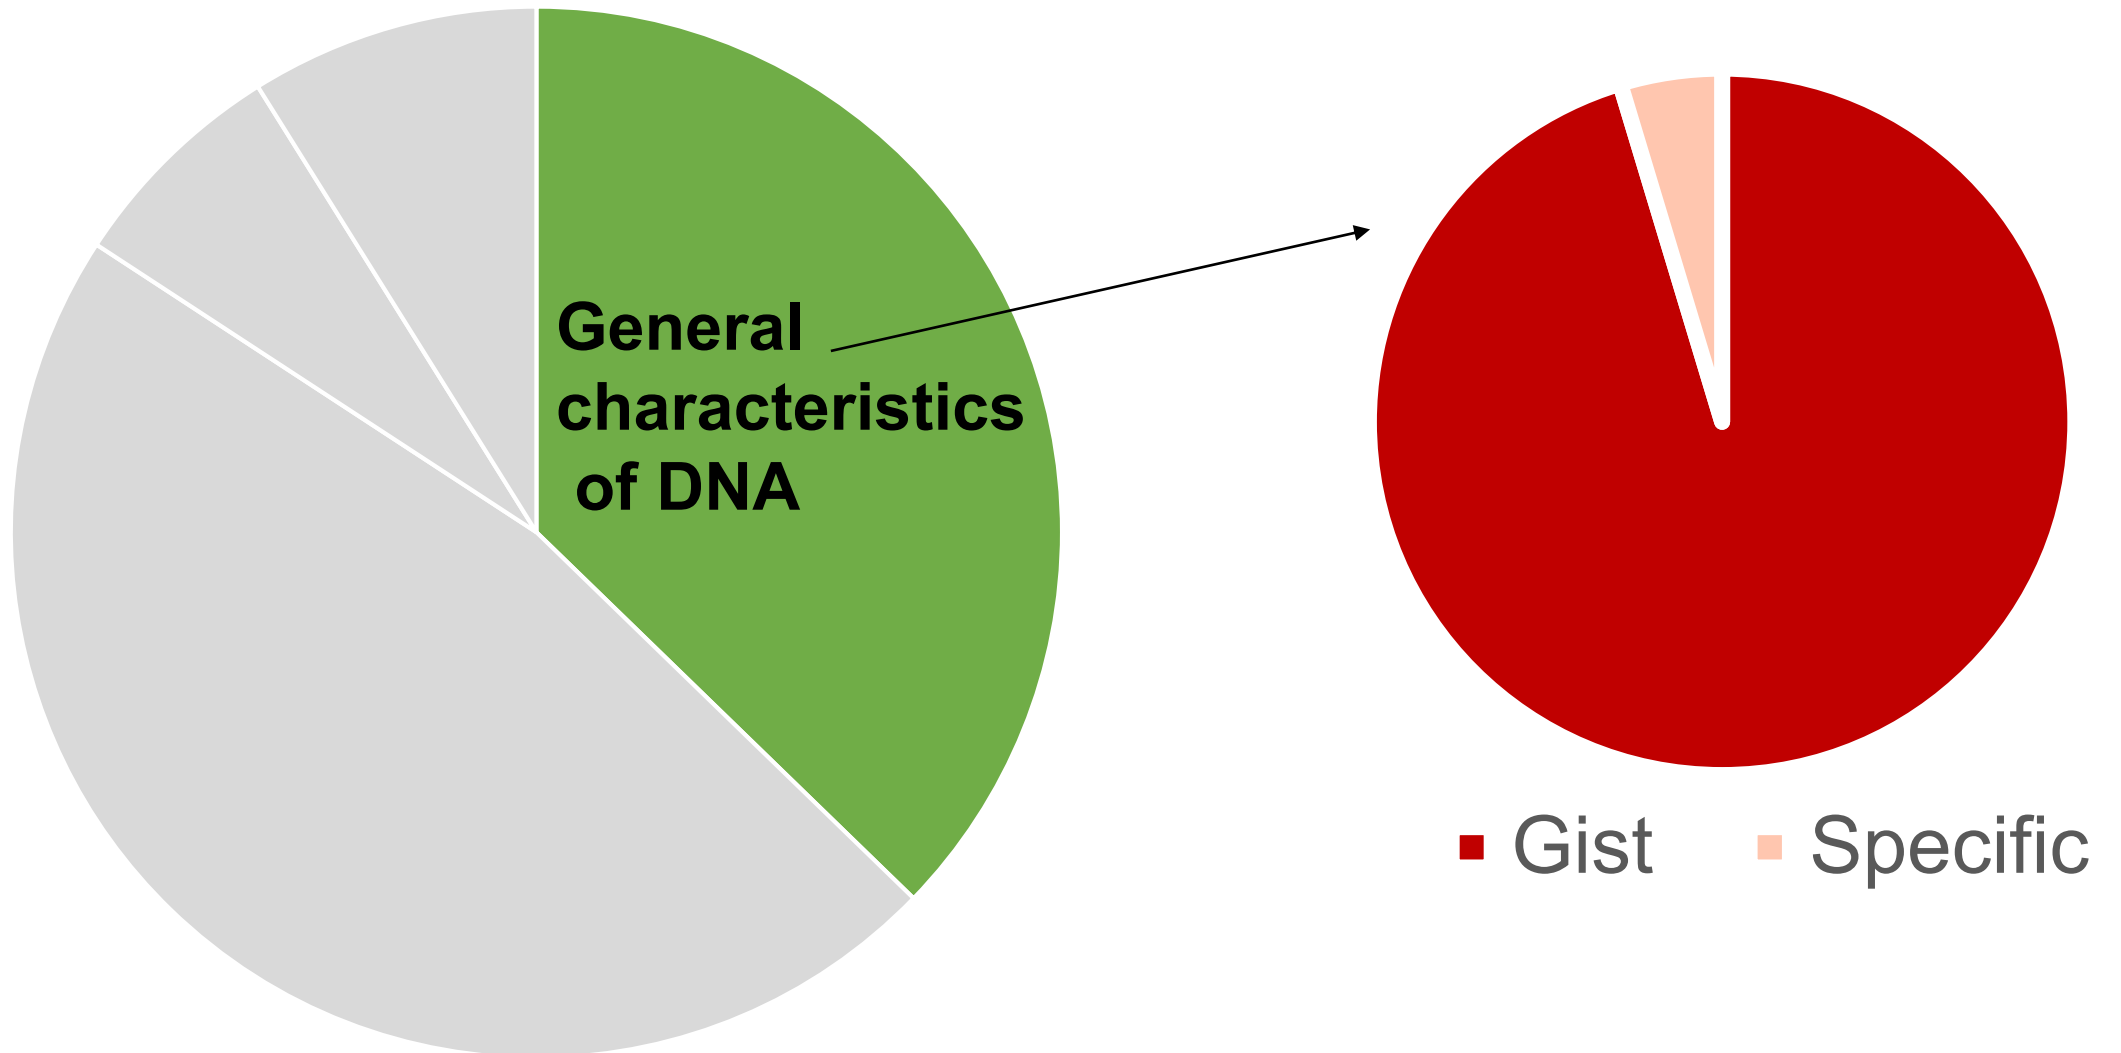

Chance of brother
committing crime

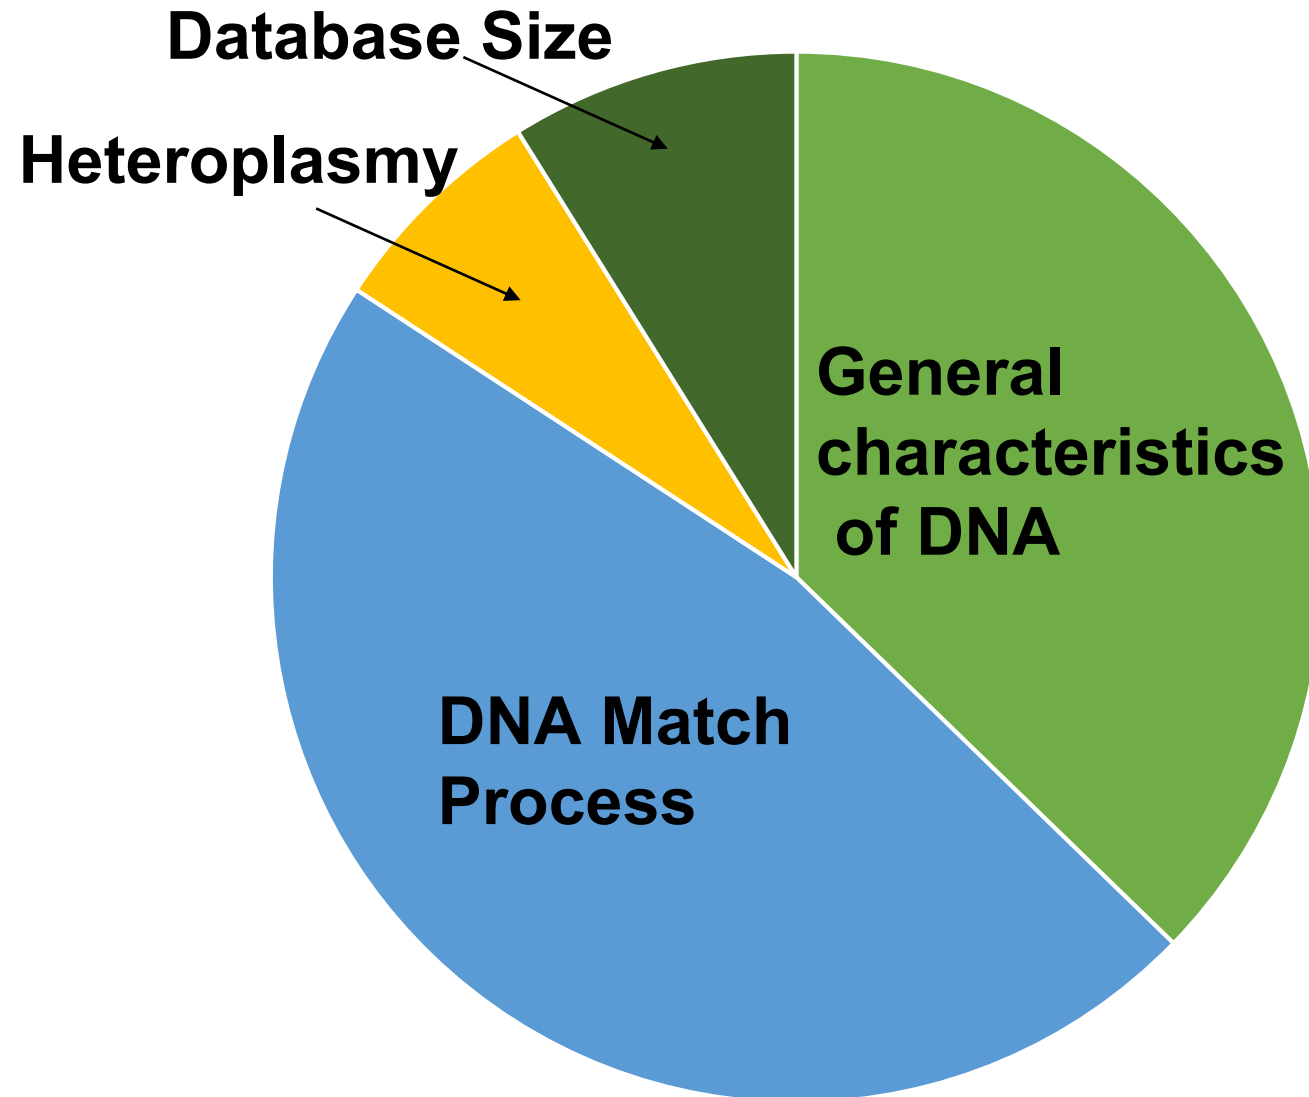

Content of DNA mention

Content of DNA mention

Content of DNA mention

- General characteristics of DNA
 - **Gist = 94.1%**
 - Specific = 4.6%
- DNA match process
 - **Gist = 52.8%**
 - Specific = 47.2%
- Heteroplasmy
 - **Gist = 70.6%**
 - Specific = 29.4%
- Database size
 - **Gist = 60.2%**
 - Specific = 39.8%

Mentions Evidence Reliability

- Reliability – 219, 22.1%
- “not enough proof”

90% of jurors mentioned evidence reliability

not enough nuclear DNA in
hair
mitochondrial DNA - not enough
proof

A photograph of a handwritten note on lined paper. The text is written in black ink and reads: "not enough nuclear DNA in hair", "mitochondrial DNA - not enough", and "proof". An arrow points from the "not enough proof" bullet point in the list above to this note.

Discussion

- Jurors create both gist and verbatim representations of evidence in their notes, but gist representations are more common
- Jurors are focusing equally on scientific and non-scientific evidence
 - Attending to both kinds of evidence
- Future directions
 - Do juror notes focus more as a memory aid than an understanding aid?
 - How do juror notes correlate with deliberation behaviors?
 - Do jurors with more verbatim representations have more impact in deliberation processes?
 - Do individual differences in jurors' cognitive styles relate with how they take notes? Do these differences matter during deliberation?"
