BOUNDS ON ORTHOGONAL POLYNOMIALS AND SEPARATION OF THEIR ZEROS

¹ELI LEVIN AND ²D. S. LUBINSKY

ABSTRACT. Let $\{p_n\}$ denote the orthonormal polynomials associated with a measure μ with compact support on the real line. Let μ be regular in the sense of Stahl, Totik, and Ullmann, and I be a subinterval of the support in which μ is absolutely continuous, while μ' is positive and continuous there. We show that boundedness of the $\{p_n\}$ in that subinterval is closely related to the spacing of zeros of p_n and p_{n-1} in that interval. One ingredient is proving that "local limits" imply universality limits.

Research supported by NSF grant DMS1800251

1. Results

Let μ be a finite positive Borel measure with compact support, which we denote by $\text{supp}[\mu]$. Then we may define orthonormal polynomials

$$p_n(x) = \gamma_n x^n + ..., \gamma_n > 0,$$

 $n = 0, 1, 2, \dots$ satisfying the orthonormality conditions

$$\int p_n p_m d\mu = \delta_{mn}.$$

The zeros of p_n are real and simple. We list them in decreasing order:

$$x_{1n} > x_{2n} > \dots > x_{n-1,n} > x_{nn}$$
.

They interlace the zeros y_{in} of p'_n :

$$p'_{n}(y_{jn}) = 0$$
 and $y_{jn} \in (x_{j+1,n}, x_{jn}), 1 \le j \le n-1.$

It is a classic result that the zeros of p_n and p_{n-1} also interlace. The three term recurrence relation has the form

$$(x - b_n) p_n (x) = a_{n+1} p_{n+1} (x) + a_n p_{n-1} (x),$$

where for n > 1,

$$a_{n} = \frac{\gamma_{n-1}}{\gamma_{n}} = \int x p_{n-1}(x) p_{n}(x) d\mu(x); \ b_{n} = \int x p_{n}^{2}(x) d\mu(x).$$

Uniform boundedness of orthonormal polynomials is a long studied topic. For example, given an interval I, one asks whether

$$\sup_{n\geq 1} \|p_n\|_{L_{\infty}(I)} < \infty.$$

There is an extensive literature on this fundamental question - see for example [1], [2], [3], [4], [12]. In this paper, we establish a connection to the distance between zeros of p_n and p_{n-1} .

The results require more terminology: we let $dist(a, \mathbb{Z})$ denote the distance from a real number a to the integers. We say that μ is regular (in the sense of Stahl, Totik, and Ullmann) if for every sequence of non-zero polynomials $\{P_n\}$ with degree P_n at most n,

$$\limsup_{n \to \infty} \left(\frac{|P_n(x)|}{\left(\int |P_n|^2 d\mu \right)^{1/2}} \right)^{1/n} \le 1$$

for quasi-every $x \in \operatorname{supp}[\mu]$ (that is except in a set of logarithmic capacity 0). If the support consists of finitely many intervals, and $\mu' > 0$ a.e. in each subinterval, then μ is regular, though much less is required [15]. An equivalent formulation involves the leading coefficients $\{\gamma_n\}$ of the orthonormal polynomials for μ :

$$\lim_{n \to \infty} \gamma_n^{1/n} = \frac{1}{cap\left(\text{supp}\left[\mu\right]\right)},$$

where cap denotes logarithmic capacity.

Recall that the equilibrium measure for the compact set $supp[\mu]$ is the probability measure that minimizes the energy integral

$$\int \int \log \frac{1}{|x-y|} d\nu (x) d\nu (y)$$

amongst all probability measures ν supported on $\operatorname{supp}[\mu]$. If I is an interval contained in $\operatorname{supp}[\mu]$, then the equilibrium measure is absolutely continuous in I, and moreover its density, which we denote throughout by ω , is positive and continuous in the interior I^o of I [13, p.216, Thm. IV.2.5]. Given sequences $\{x_n\}$, $\{y_n\}$ of non-0 real numbers, we write

$$x_n \sim y_n$$

if there exists C > 1 such that for n > 1,

$$C^{-1} \le x_n/y_n < C.$$

Similar notation is used for functions and sequences of functions. Our main result is

Theorem 1.1

Let μ be a regular measure on \mathbb{R} with compact support. Let I be a closed subinterval of the support and assume that in some open interval containing I, μ is absolutely continuous, while μ' is positive and continuous. Let ω be the density of the equilibrium measure for the support of μ . Let A > 0. The following are equivalent:

(a) There exists C > 0 such that for $n \ge 1$ and $x_{in} \in I$,

$$(1.1) dist \left(n\omega\left(x_{jn}\right)\left(x_{jn}-x_{j,n-1}\right),\mathbb{Z}\right) \geq C.$$

(b) There exists C > 0 such that for $n \ge 1$ and $y_{in} \in I$,

$$(1.2) dist (n\omega (y_{jn}) (y_{jn} - y_{j,n-1}), \mathbb{Z}) \ge C.$$

(c) Uniformly for $n \geq 1$ and $x \in I$,

(1.3)
$$||p_{n-1}||_{L_{\infty}[x-\frac{A}{n},x+\frac{A}{n}]} ||p_n||_{L_{\infty}[x-\frac{A}{n},x+\frac{A}{n}]} \sim 1.$$

(d) There exists C > 0 such that for $n \ge 1$ and $x \in I$,

(1.4)
$$||p_{n-1}||_{L_{\infty}[x-\frac{A}{n},x+\frac{A}{n}]} ||p_n||_{L_{\infty}[x-\frac{A}{n},x+\frac{A}{n}]} \le C.$$

Moreover, under any of (a), (b), (c), (d), we have

(1.5)
$$\sup_{n\geq 1} \sup_{x\in I} \left| \left| x - b_n \right|^{1/2} p_n(x) \right| < \infty.$$

Remarks

(a) The main idea behind the proof is that universality limits and "local" limits give

$$|p_{n-1}(y_{j,n-1})p_n(y_{jn})| |\sin [\pi n\omega (y_{jn})(y_{jn}-y_{j,n-1})] + o(1)| \sim 1,$$

uniformly in j, n, while p_n has a local extremum at y_{jn} .

- (b) We could replace $x_{j,n-1} x_{jn}$ in (1.1) by $x_{j,n-1} x_{j,n+k}$, for any fixed integer k (see Lemma 4.1).
- (b) Under additional assumptions, involving the spacing of zeros of p_n and p_{n-2} , we can remove the factor $|x b_n|^{1/2}$ in (1.5):

Theorem 1.2

Let μ be a regular measure on \mathbb{R} with compact support. Let I be a closed subinterval of the support and assume that in some open interval containing I, μ is absolutely continuous, while μ' is positive and continuous. Let ω be the density of the equilibrium measure for the support of μ . Let A>0. Assume that (1.1) holds in I. The following are equivalent:

(a) There exist $C_1 > 0$ such that for $n \ge 1$ and $x_{jn} \in I$,

$$(1.6) |n(x_{jn} - x_{j-1,n-2})| \ge C_1 |x_{jn} - b_{n-1}|.$$

(b) Uniformly for $x \in I$ and $n \ge 1$,

(c)

$$(1.8) \qquad \sup_{n\geq 1} \|p_n\|_{L_{\infty}(I)} < \infty.$$

Remark

We note that because of the interlacing, both x_{jn} and $x_{j-1,n-2}$ belong to the interval $(x_{j,n-1}, x_{j-1,n-1})$.

Two important ingredients in our proofs are universality and local limits. The so-called universality limit involves the reproducing kernel

$$K_{n}(x,y) = \sum_{k=0}^{n-1} p_{k}(x) p_{k}(y) = \frac{\gamma_{n-1}}{\gamma_{n}} \frac{p_{n}(x) p_{n-1}(y) - p_{n-1}(x) p_{n}(y)}{x - y}.$$

(1.9)

For x in the interior of $\text{supp}[\mu]$ (the "bulk" of the support), at least when $\mu'(x)$ is finite and positive, the universality limit typically takes the form [6], [8], [14], [17]

(1.10)
$$\lim_{n \to \infty} \frac{K_n \left(x + \frac{a}{\mu'(x)K_n(x,x)}, x + \frac{b}{\mu'(x)K_n(x,x)} \right)}{K_n \left(x, x \right)} = \mathbb{S} \left(a - b \right),$$

uniformly for a, b in compact subsets of \mathbb{C} . Here \mathbb{S} is the sinc kernel,

$$\mathbb{S}\left(a\right) = \frac{\sin \pi a}{\pi a}.$$

Universality limits holds far more generally than pointwise asymptotics for orthonormal polynomials, that at one stage were used to prove them. In a series of recent papers [7], [9], [10], [11], it was shown that one can go in the other direction, namely from universality limits, to "local ratio limits" for orthogonal polynomials.

Under fairly general conditions on μ , the Christoffel function $K_n(x, x)$ admits the asymptotic [16]

$$\lim_{n\to\infty} \frac{1}{n} K_n(x, x) \mu'(x) = \omega(x)$$

for x in the interior of the support of μ . This allows us to reformulate the universality limit (1.10) as

(1.11)
$$\lim_{n \to \infty} \frac{K_n \left(x + \frac{a}{n\omega(x)}, x + \frac{b}{n\omega(x)} \right) \mu'(x)}{n\omega(x)} = \mathbb{S} \left(a - b \right),$$

uniformly for a, b in compact subsets of \mathbb{C} .

Using this universality limit, we proved in [10]:

Theorem A

Assume that μ is a regular measure with compact support. Let I be a closed subinterval of the support in which μ is absolutely continuous, and μ' is positive and continuous. Let J be a compact subset of the interior I^o of I. Then

(1.12)
$$\lim_{n \to \infty} \frac{p_n \left(y_{jn} + \frac{z}{n\omega(y_{jn})} \right)}{p_n \left(y_{jn} \right)} = \cos \pi z$$

uniformly for $y_{jn} \in J$ and z in compact subsets of \mathbb{C} .

A secondary goal of this paper is to prove a converse of Theorem A, namely to show that local limits such as (1.12) imply a universality limit like (1.11). For measures on the unit circle this was undertaken in [11] - however the results necessarily take a quite different form.

Theorem 1.3

Let μ be a measure with compact support. Assume that we are given a bounded sequence of real numbers $\{\xi_n\}$ such that

$$(1.13) \qquad \sup_{n \ge 1} n \left| \xi_n - \xi_{n-1} \right| < \infty,$$

and a sequence $\{\tau_n\}$ of positive numbers with $\tau_n \sim 1$ such that

$$\lim_{n \to \infty} \frac{\tau_n}{\tau_{n-1}} = 1$$

and uniformly for z in compact subsets of \mathbb{C} ,

(1.15)
$$\lim_{n \to \infty} \frac{p_n \left(\xi_n + \frac{\tau_n}{n} z\right)}{p_n \left(\xi_n\right)} = \cos \pi z.$$

Let A > 0. Then uniformly for a, b in compact subsets of \mathbb{C} , and x_n such that

$$(1.16) |x_n - \xi_n| \le \frac{A}{n}$$

we have

(1.17)

$$\frac{K_n\left(x_n + \frac{\tau_n}{n}a, x_n + \frac{\tau_n}{n}b\right)}{K_n\left(x_n, x_n\right)} = \mathbb{S}\left(a - b\right) + o\left(\frac{\frac{\gamma_{n-1}}{\gamma_n}n\left|p_{n-1}\left(\xi_{n-1}\right)p_n\left(\xi_n\right)\right|}{K_n\left(x_n, x_n\right)}\right).$$

Moreover,

(1.18)
$$\frac{K_n \left(x_n + \frac{\tau_n}{n} a, x_n + \frac{\tau_n}{n} b \right)}{K_n \left(x_n, x_n \right)} = \mathbb{S} \left(a - b \right) + o \left(1 \right),$$

provided either

(1.19)
$$\liminf_{n \to \infty} \operatorname{dist} \left(\frac{n}{\tau_n} \left(\xi_n - \xi_{n-1} \right), \mathbb{Z} \right) > 0$$

or

(1.20)
$$\sup_{n\geq 1} \frac{\frac{\gamma_{n-1}}{\gamma_n} n \left| p_{n-1} \left(\xi_{n-1} \right) p_n \left(\xi_n \right) \right|}{K_n \left(x_n, x_n \right)} < \infty.$$

We prove Theorem 1.3 in the next section and Theorem 1.1 in Section 3. Theorem 1.2 is proved in Section 4. In the sequel $C, C_1, C_2, ...$ denote constants independent of n, x, θ . The same symbol does not necessarily denote the same constant in different occurrences.

2. Proof of Theorem 1.3

Throughout this section, we assume the hypotheses of Theorem 1.3. Write for $n \geq 1$ and m = n - 1, n,

$$(2.1) x_n = \xi_m + \Delta_{n,m} \frac{\tau_m}{m}$$

and

(2.2)
$$\chi_n = \left(\frac{\tau_n}{n}\right) / \left(\frac{\tau_{n-1}}{n-1}\right).$$

Recall from (1.14) that $\chi_n \to 1$ as $n \to \infty$. Note too that in view of (1.13), (1.14), (1.16), $\{\Delta_{n,n}\}$ and $\{\Delta_{n,n-1}\}$ are bounded sequences. We start with:

Lemma 2.1

(a) Uniformly for z in compact subsets of \mathbb{C} ,

(2.3)
$$\lim_{n \to \infty} \frac{\tau_n}{n} \frac{p'_n\left(\xi_n + \frac{\tau_n}{n}z\right)}{p_n\left(\xi_n\right)} = -\pi \sin \pi z.$$

(b) Uniformly for a, b in compact subsets of \mathbb{C} ,

$$\left(p_n\left(x_n + \frac{\tau_n}{n}a\right) - p_n\left(x_n + \frac{\tau_n}{n}b\right)\right)/p_n\left(\xi_n\right)$$

$$= -\pi \int_b^a \sin\pi\left(\Delta_{n,n} + t\right) dt + o\left(|a - b|\right).$$

(c) Moreover,

$$\left(p_{n-1}\left(x_n + \frac{\tau_n}{n}a\right) - p_{n-1}\left(x_n + \frac{\tau_n}{n}b\right)\right)/p_{n-1}\left(\xi_{n-1}\right)$$

$$= -\pi \int_b^a \sin\pi \left(\Delta_{n,n-1} + t\right) dt + o\left(|a - b|\right).$$

Proof

(a) As the asymptotic (1.15) holds uniformly for z in compact subsets of the plane, we can differentiate it to obtain (2.3).

(b) Now

$$\left(p_n\left(x_n + \frac{\tau_n}{n}a\right) - p_n\left(x_n + \frac{\tau_n}{n}b\right)\right)/p_n\left(\xi_n\right)$$

$$= \int_b^a p_n'\left(x_n + \frac{\tau_n}{n}t\right)\frac{\tau_n}{n}dt/p_n\left(\xi_n\right).$$

Note that this is meaningful even for complex a, b, with the integral being taken over the directed line segment from b to a. Using (2.1) and (2.3), we continue this as

$$\int_{b}^{a} \frac{p'_{n} \left(\xi_{n} + \frac{\tau_{n}}{n} \left(\Delta_{n,n} + t\right)\right) \frac{\tau_{n}}{n}}{p_{n} \left(\xi_{n}\right)} dt$$

$$= \int_{b}^{a} \left(-\pi \sin \pi \left(\Delta_{n,n} + t\right) + o\left(1\right)\right) dt$$

$$= -\pi \int_{b}^{a} \sin \pi \left(\Delta_{n,n} + t\right) dt + o\left(|a - b|\right).$$

(c) Using (2.2),

$$\left(p_{n-1} \left(x_n + \frac{\tau_n}{n} a \right) - p_{n-1} \left(x_n + \frac{\tau_n}{n} b \right) \right) / p_{n-1} \left(\xi_{n-1} \right)$$

$$= \int_b^a p'_{n-1} \left(x_n + \frac{\tau_n}{n} t \right) \frac{\tau_n}{n} dt / p_{n-1} \left(\xi_{n-1} \right)$$

$$= \int_b^a \frac{p'_{n-1} \left(\xi_{n-1} + \frac{\tau_{n-1}}{n-1} \left(\Delta_{n,n-1} + \chi_n t \right) \right)}{p_{n-1} \left(\xi_{n-1} \right)} \frac{\tau_{n-1}}{n-1} \chi_n dt$$

$$= \int_b^a \left(-\pi \sin \left(\pi \left(\Delta_{n,n-1} + \chi_n t \right) \right) + o(1) \right) dt$$

$$= -\pi \int_b^a \sin \pi \left(\Delta_{n,n-1} + t \right) dt + o(|a-b|) .$$

Proof of Theorem 1.3

We apply (1.15) and (b), (c) of Lemma 2.1. Now if $a \neq b$,

$$\frac{\tau_{n}}{np_{n-1}\left(\xi_{n-1}\right)p_{n}\left(\xi_{n}\right)}K_{n}\left(x_{n} + \frac{\tau_{n}}{n}a, x_{n} + \frac{\tau_{n}}{n}b\right)
= \frac{\gamma_{n-1}}{\gamma_{n}} \frac{\left[p_{n}\left(x_{n} + \frac{\tau_{n}}{n}a\right) - p_{n}\left(x_{n} + \frac{\tau_{n}}{n}b\right)\right]p_{n-1}\left(x_{n} + \frac{\tau_{n}}{n}b\right)}{(a-b)p_{n}\left(\xi_{n}\right)p_{n-1}\left(\xi_{n-1}\right)}
+ \frac{\gamma_{n-1}}{\gamma_{n}} \frac{p_{n}\left(x_{n} + \frac{\tau_{n}}{n}b\right)\left[p_{n-1}\left(x_{n} + \frac{\tau_{n}}{n}b\right) - p_{n-1}\left(x_{n} + \frac{\tau_{n}}{n}a\right)\right]}{(a-b)p_{n}\left(\xi_{n}\right)p_{n-1}\left(\xi_{n-1}\right)}
= \frac{\gamma_{n-1}}{\gamma_{n}} \left[\frac{-\pi}{a-b}\int_{b}^{a}\sin\pi\left(\Delta_{n,n} + t\right) dt + o\left(1\right)\right]\left[\cos\pi\left(\Delta_{n,n-1} + b\chi_{n}\right) + o\left(1\right)\right]
+ \frac{\gamma_{n-1}}{\gamma_{n}}\left[\cos\pi\left(\Delta_{n,n} + b\right) + o\left(1\right)\right]\left[\frac{\pi}{a-b}\int_{b}^{a}\sin\pi\left(\Delta_{n,n-1} + t\right) dt + o\left(1\right)\right]$$

by (1.15) and (b), (c) of Lemma 2.1. Note that because of the uniformity of the limits, this holds in a confluent form even if a = b. We continue this, using $\chi_n = 1 + o(1)$, as

$$= \frac{\gamma_{n-1}}{\gamma_n} \frac{\pi}{a-b} \int_a^b \left[\sin \pi \left(\Delta_{n,n} + t \right) \cos \pi \left(\Delta_{n,n-1} + b \right) - \cos \pi \left(\Delta_{n,n} + b \right) \sin \pi \left(\Delta_{n,n-1} + t \right) \right] dt + o \left(\frac{\gamma_{n-1}}{\gamma_n} \right).$$

(2.4)

Next, we expand the integrand using double angle formulae, in a straightforward but tedious fashion:

$$\sin \pi \left(\Delta_{n,n} + t\right) \cos \pi \left(\Delta_{n,n-1} + b\right) - \cos \pi \left(\Delta_{n,n} + b\right) \sin \pi \left(\Delta_{n,n-1} + t\right)$$

$$= \left[\sin \pi \Delta_{n,n} \cos \pi t + \cos \pi \Delta_{n,n} \sin \pi t\right] \left[\cos \pi \Delta_{n,n-1} \cos \pi b - \sin \pi \Delta_{n,n-1} \sin \pi b\right]$$

$$- \left[\cos \pi \Delta_{n,n} \cos \pi b - \sin \pi \Delta_{n,n} \sin \pi b\right] \left[\sin \pi \Delta_{n,n-1} \cos \pi t + \cos \pi \Delta_{n,n-1} \sin \pi t\right]$$

$$= \cos \pi t \cos \pi b \sin \pi \left(\Delta_{n,n} - \Delta_{n,n-1}\right) + \sin \pi t \sin \pi b \sin \pi \left(\Delta_{n,n} - \Delta_{n,n-1}\right)$$

$$= \cos \left(\pi \left(t - b\right)\right) \sin \pi \left(\Delta_{n,n} - \Delta_{n,n-1}\right).$$

We can then continue (2.4) as

$$\frac{\gamma_{n-1}}{\gamma_n} \frac{\pi}{a-b} \int_a^b \left[\cos \left(\pi \left(t - b \right) \right) \sin \pi \left(\Delta_{n,n} - \Delta_{n,n-1} \right) \right] dt + o \left(\frac{\gamma_{n-1}}{\gamma_n} \right)$$

$$= \frac{\gamma_{n-1}}{\gamma_n} \sin \pi \left(\Delta_{n,n} - \Delta_{n,n-1} \right) \frac{1}{a-b} \left(-\sin \pi \left(a - b \right) \right) + o \left(\frac{\gamma_{n-1}}{\gamma_n} \right)$$

$$= -\pi \frac{\gamma_{n-1}}{\gamma_n} \sin \pi \left(\Delta_{n,n} - \Delta_{n,n-1} \right) \mathbb{S} \left(a - b \right) + o \left(\frac{\gamma_{n-1}}{\gamma_n} \right).$$

In summary, uniformly for a, b in compact subsets of the plane,

$$\frac{\tau_n}{np_{n-1}\left(\xi_{n-1}\right)p_n\left(\xi_n\right)}K_n\left(x_n + \frac{\tau_n}{n}a, x_n + \frac{\tau_n}{n}b\right)$$
(2.5)
$$= -\pi \frac{\gamma_{n-1}}{\gamma_n}\sin\pi\left(\Delta_{n,n} - \Delta_{n,n-1}\right)\mathbb{S}\left(a - b\right) + o\left(\frac{\gamma_{n-1}}{\gamma_n}\right).$$

Next observe from (2.1), (1.13), and (1.14), that

$$x_n = \xi_n + \Delta_{n,n} \frac{\tau_n}{n} = \xi_{n-1} + \Delta_{n,n-1} \frac{\tau_n}{n} + o\left(\frac{1}{n}\right)$$
$$\Rightarrow \frac{\tau_n}{n} \left[\Delta_{n,n} - \Delta_{n,n-1}\right] = \xi_{n-1} - \xi_n + o\left(\frac{1}{n}\right).$$

As τ_n is bounded below, this allows us to reformulate (2.5) as

$$\frac{\tau_n}{n} K_n \left(x_n + \frac{\tau_n}{n} a, x_n + \frac{\tau_n}{n} b \right)$$

$$= -\pi \frac{\gamma_{n-1}}{\gamma_n} p_{n-1} \left(\xi_{n-1} \right) p_n \left(\xi_n \right) \left\{ \sin \left[\pi \frac{n}{\tau_n} \left(\xi_{n-1} - \xi_n \right) \right] \mathbb{S} \left(a - b \right) + o \left(1 \right) \right\}.$$

(2.6)

In particular, setting a = b = 0,

$$\frac{\tau_n}{n} K_n(x_n, x_n)$$

$$= -\pi \frac{\gamma_{n-1}}{\gamma_n} p_{n-1}(\xi_{n-1}) p_n(\xi_n) \left\{ \sin \left[\pi \frac{n}{\tau_n} \left(\xi_{n-1} - \xi_n \right) \right] + o(1) \right\},$$

(2.7)

so that (2.6) can be recast as

$$\frac{\tau_n}{n} K_n \left(x_n + \frac{\tau_n}{n} a, x_n + \frac{\tau_n}{n} b \right)
= \frac{\tau_n}{n} K_n \left(x_n, x_n \right) \mathbb{S} \left(a - b \right) + o \left(\frac{\gamma_{n-1}}{\gamma_n} \left| p_{n-1} \left(\xi_{n-1} \right) p_n \left(\xi_n \right) \right| \right),$$

giving (1.17). If (1.19) holds, then $\sin \left[\pi \frac{n}{\tau_n} \left(\xi_{n-1} - \xi_n\right)\right]$ is bounded away from 0, so we can reformulate (2.6) as

$$\frac{\tau_n}{n} K_n \left(x_n + \frac{\tau_n}{n} a, x_n + \frac{\tau_n}{n} b \right)$$

$$= -\pi \frac{\gamma_{n-1}}{\gamma_n} p_{n-1} \left(\xi_{n-1} \right) p_n \left(\xi_n \right) \sin \left[\pi \frac{n}{\tau_n} \left(\xi_{n-1} - \xi_n \right) \right] \left\{ \mathbb{S} \left(a - b \right) + o \left(1 \right) \right\}$$

and (2.7) as

$$\frac{\tau_n}{n} K_n (x_n, x_n)$$

$$= -\pi \frac{\gamma_{n-1}}{\gamma_n} p_{n-1} (\xi_{n-1}) p_n (\xi_n) \sin \left[\pi \frac{n}{\tau_n} (\xi_{n-1} - \xi_n) \right] \{1 + o(1)\}.$$

Together these give (1.18). Finally if (1.20) holds, then we see from (2.6) that necessarily $\sin \left[\pi \frac{n}{\tau_n} \left(\xi_{n-1} - \xi_n\right)\right]$ is bounded away from 0 and again (1.18) follows.

3. Proof of Theorem 1.1

Recall that y_{jn} is the zero of p'_n in $(x_{j+1,n}, x_{jn})$. We begin with:

Lemma 3.1

Let μ be a regular measure on \mathbb{R} with compact support. Let I be a closed subinterval of the support and assume that in some open interval containing I, μ is absolutely continuous, while μ' is positive and continuous.

(a) Uniformly for $y_{jn} \in I$,

(3.1)
$$\lim_{n \to \infty} n (x_{jn} - y_{jn}) \omega (x_{jn}) = \frac{1}{2} = \lim_{n \to \infty} n (y_{jn} - x_{j+1,n}) \omega (x_{jn});$$

(3.2)
$$\lim_{n \to \infty} n (x_{jn} - x_{j+1,n}) \omega (x_{jn}) = 1;$$

(3.3)
$$\lim_{n \to \infty} n (y_{jn} - y_{j+1,n}) \omega (x_{jn}) = 1.$$

(b) Uniformly for $y_{jn} \in I$,

(3.4)

$$\frac{\gamma_{n-1}}{\gamma_n} |p_{n-1}(y_{j,n-1}) p_n(y_{jn})| |\sin [\pi n\omega (y_{jn}) (y_{j,n-1} - y_{jn})] + o(1)| \sim 1.$$

(c) Fix A > 0. Uniformly for $n \ge 1$ and $x \in I$,

(3.5)
$$||p_n||_{L_{\infty}\left[x-\frac{A}{n},x+\frac{A}{n}\right]} \sim |p_n(y_{jn})|,$$

where $y_{jn} \in \left[x - \frac{A}{n}, x + \frac{A}{n}\right]$ or is the closest zero of p'_n to this interval.

(a) First note that uniformly for $y_{jn} \in I$ and z in compact subsets of \mathbb{C} ,

(3.6)
$$\lim_{n \to \infty} \frac{p_n \left(y_{jn} + \frac{z}{n\omega(y_{jn})} \right)}{p_n \left(y_{jn} \right)} = \cos \pi z.$$

This was proved in [10] and is Theorem A above. Next, Theorem 2.1 in [17] shows that (3.2) holds uniformly for $x_{jn} \in I$. In particular $x_{jn} - x_{j+1,n} = O\left(\frac{1}{n}\right)$ uniformly for $x_{jn} \in I$. Write

$$x_{jn} = y_{jn} + \frac{z_n}{n\omega\left(y_{jn}\right)},$$

so that $z_n > 0$ and $z_n = O(1)$. From (3.6), we have

$$0 = \frac{p_n(x_{jn})}{p_n(y_{jn})} = \cos \pi z_n + o(1)$$

so necessarily for some non-negative integer j_n ,

$$z_{jn} = j_n + \frac{1}{2} + o(1)$$
.

If $j_n \geq 1$ for infinitely many n, then Hurwitz' Theorem shows that there would be other zeros of p_n between x_{jn} and y_{jn} , which contradicts that $y_{jn} \in (x_{j+1,n}, x_{jn})$. So $j_n = 0$ for n large enough, which gives the first limit in (3.1). Note too that $\omega(x_{jn})/\omega(y_{jn}) = 1 + o(1)$ by continuity of ω . The second is similar. Both (3.2) and (3.3) follow from (3.1), though as noted, (3.2) appears in [17].

(b) Because of (3.6), we can apply Theorem 1.3 and results from its proof. In that theorem, we set $x_n = y_{jn}$, $\tau_n = \frac{1}{\omega(y_{jn})}$; $\xi_n = y_{jn}$; so that $\xi_{n-1} = y_{j,n-1}$. Note that (1.13), (1.14), (1.16) are satisfied because of the spacing estimates in Lemma 3.1, and the continuity of ω . From (2.7),

$$\frac{1}{n\omega(y_{jn})}K_{n}(y_{jn}, y_{jn})
= -\pi \frac{\gamma_{n-1}}{\gamma_{n}} p_{n-1}(y_{j,n-1}) p_{n}(y_{jn}) \left\{ \sin \left[\pi n\omega(y_{jn}) (y_{j,n-1} - y_{jn}) \right] + o(1) \right\}.$$

(3.7)

Next, Theorem 2.2 in [17] establishes that uniformly for $t \in I$,

$$\lim_{n\to\infty}\frac{1}{n}K_n\left(t,t\right)\mu'\left(t\right)=\omega\left(t\right).$$

Since ω is positive and continuous in I as is μ' , we then obtain (3.4) from (3.7).

(c) This follows directly from the limit in (3.6) and the fact that $|p_n(y_{jn})|$ is the maximum of $|p_n|$ in $[x_{j+1,n}, x_{jn}]$.

Proof that Theorem $1.1(a)\Leftrightarrow(b)$

This follows directly from Lemma 3.1(a). \blacksquare

Proof that Theorem $1.1(b) \Rightarrow (c)$.

First note that as $supp[\mu]$ is compact [5, p. 41],

$$\frac{\gamma_{n-1}}{\gamma_n} \le C.$$

Our hypothesis (1.2), as well as (3.4) give that uniformly for $y_{jn} \in I$,

(3.9)
$$\frac{\gamma_{n-1}}{\gamma_n} |p_{n-1}(y_{j,n-1}) p_n(y_{jn})| \sim 1.$$

Then (3.5) gives uniformly for $x \in I$,

(3.10)
$$\frac{\gamma_{n-1}}{\gamma_n} \|p_{n-1}\|_{L_{\infty}\left[x-\frac{A}{n},x+\frac{A}{n}\right]} \|p_n\|_{L_{\infty}\left[x-\frac{A}{n},x+\frac{A}{n}\right]} \sim 1.$$

Let $I_{jn} = [y_{j+1,n}, y_{jn}]$ for all j, n. We similarly obtain from (3.6) and (3.9) and our spacing that

$$\frac{\gamma_{n-1}}{\gamma_n} \left(\int_{I_{j,n-1}} p_{n-1}^2 d\mu \right)^{1/2} \left(\int_{I_{jn}} p_n^2 d\mu \right)^{1/2} \ge \frac{C}{n}.$$

Here we are also using that μ' is positive and continuous in I. Adding over $y_{jn} \in I$, and using that there are necessarily $\geq Cn$ such y_{jn} , because of the spacing, we obtain

$$\frac{\gamma_{n-1}}{\gamma_n} \sum_{y_{in} \in I} \left(\int_{I_{j,n-1}} p_{n-1}^2 d\mu \right)^{1/2} \left(\int_{I_{jn}} p_n^2 d\mu \right)^{1/2} \ge C.$$

Cauchy-Schwarz' inequality gives

$$\frac{\gamma_{n-1}}{\gamma_n} \left(\int p_{n-1}^2 d\mu \int p_n^2 d\mu \right)^{1/2} \ge C$$

so that

$$\frac{\gamma_{n-1}}{\gamma_n} \ge C.$$

Together with (3.8), this gives

$$(3.11) a_n = \frac{\gamma_{n-1}}{\gamma_n} \sim 1.$$

So from (3.10), uniformly in $x \in I$,

(3.12)
$$||p_{n-1}||_{L_{\infty}\left[x-\frac{A}{n},x+\frac{A}{n}\right]} ||p_n||_{L_{\infty}\left[x-\frac{A}{n},x+\frac{A}{n}\right]} \sim 1.$$

Proof that Theorem $1.1(c) \Rightarrow (d)$.

This is immediate. \blacksquare

Proof that Theorem $1.1(d) \Rightarrow (b)$.

From (3.4), (3.11), and our assumed bound (1.4),

$$\left|\sin\left[\pi n\omega\left(y_{jn}\right)\left(y_{j,n-1}-y_{jn}\right)\right]+o\left(1\right)\right|\geq C.$$

This yields

$$dist\left(n\omega\left(y_{jn}\right)\left(y_{jn}-y_{j,n-1}\right),\mathbb{Z}\right)\geq C.$$

Proof of the bound (1.5)

From the recurrence relation and (3.11),

$$\|(x-b_n) p_n\|_{L_{\infty}\left[x-\frac{A}{n},x+\frac{A}{n}\right]} \|p_n\|_{L_{\infty}\left[x-\frac{A}{n},x+\frac{A}{n}\right]}$$

$$\leq C \left(\|p_{n+1}\|_{L_{\infty}\left[x-\frac{A}{n},x+\frac{A}{n}\right]} \|p_n\|_{L_{\infty}\left[x-\frac{A}{n},x+\frac{A}{n}\right]} + \|p_{n-1}\|_{L_{\infty}\left[x-\frac{A}{n},x+\frac{A}{n}\right]} \|p_n\|_{L_{\infty}\left[x-\frac{A}{n},x+\frac{A}{n}\right]} \right)$$

$$\leq C,$$

by (1.4). Then also uniformly in $x \in I$,

$$\left\| \left(x - b_n \right) p_n^2 \right\|_{L_{\infty} \left[x - \frac{A}{n}, x + \frac{A}{n} \right]} \le C$$

and we obtain (1.5).

4. Proof of Theorem 1.2

We begin with:

Lemma 4.1

Let μ be a regular measure on \mathbb{R} with compact support. Let I be a closed subinterval of the support and assume that in some open interval containing I, μ is absolutely continuous, while μ' is positive and continuous. Assume (1.1). Let A > 0.

(a) Let $L \geq 1$. There exists n_0 such that uniformly for $n \geq n_0$, for $x_{jn} \in I$ and $|k-j| \leq L$,

(4.1)
$$dist \left(n\omega\left(x_{jn}\right)\left(x_{k,n-1}-x_{jn}\right),\mathbb{Z}\right) \geq C.$$

(b) Let

(4.2)
$$\delta_{jn} := n\omega(x_{jn})(x_{jn} - x_{j-1,n-2}).$$

There exist $n_0, \eta_0 > 0$ such that uniformly for $n \geq n_0$, and for $x_{jn} \in I$,

$$(4.3) |\delta_{jn}| \le 1 - \eta_0.$$

(c) There exist $n_0, C_1 > 0$ such that uniformly for $n \geq n_0$ and for $x_{jn} \in I$, we have

$$(4.4) |x_{jn} - b_{n-1}| \sim ||p_{n-2}||_{L_{\infty}[x_{jn} - \frac{A}{n}, x_{jn} + \frac{A}{n}]}^{2} |\delta_{jn}|.$$

Here if $x_{jn} - b_{n-1} = 0$, both sides are 0.

Proof

(a) Using the spacing (3.2),

$$dist (n\omega (x_{jn}) (x_{k,n-1} - x_{jn}), \mathbb{Z})$$

$$= dist (n\omega (x_{jn}) (x_{j,n-1} - x_{jn}), \mathbb{Z}) + o (1)$$

so (1.1) gives the result.

(b) The interlacing of the zeros of successive orthogonal polynomials shows that both x_{jn} and $x_{j-1,n-2}$ lie in the interval $(x_{j,n-1},x_{j-1,n-1})$. Even more, the bounds given in (a) show that for n large enough, both x_{jn} and $x_{j-1,n-2}$ lie in the interval $\left(x_{j,n-1} + \frac{C_1}{n\omega(x_{jn})}, x_{j-1,n-1} - \frac{C_1}{n\omega(x_{jn})}\right)$ for some $C_1 > 0$. Then

$$|\delta_{jn}| = |n\omega(x_{jn})(x_{jn} - x_{j-1,n-2})|$$

$$\leq n\omega(x_{jn})(x_{j,n-1} - x_{j+1,n-1}) - 2C_1 = 1 - 2C_1 + o(1),$$

by (3.2).

(c) From the recurrence relation,

$$(4.5) (x_{jn} - b_{n-1}) p_{n-1}(x_{jn}) = a_{n-1}p_{n-2}(x_{jn}).$$

We now examine the behavior of the left and right-hand side as $n \to \infty$. By (3.1) to (3.3), the local asymptotic (3.6), and the fact that $x_{jn} - y_{j,n-1} = O\left(\frac{1}{n}\right)$,

$$\frac{p_{n-1}(x_{jn})}{p_{n-1}(y_{j,n-1})} = \cos \pi \left(n\omega \left(y_{j,n-1}\right) \left(x_{jn} - y_{j,n-1}\right)\right) + o\left(1\right)
= \cos \pi \left(n\omega \left(y_{j,n-1}\right) \left(x_{jn} - x_{j,n-1} + x_{j,n-1} - y_{j,n-1}\right)\right) + o\left(1\right)
= \cos \pi \left(n\omega \left(y_{j,n-1}\right) \left(x_{jn} - x_{j,n-1}\right) + \frac{1}{2}\right) + o\left(1\right)
= -\sin \pi \left(n\omega \left(y_{j,n-1}\right) \left(x_{jn} - x_{j,n-1}\right)\right) + o\left(1\right)$$

so using our original condition (1.1), we obtain for some threshold n_0 that is independent of j, and for $n \ge n_0$,

$$(4.6) |p_{n-1}(x_{jn})| \sim |p_{n-1}(y_{j,n-1})|.$$

Next, in analyzing the term on the right in (4.5), we use the differentiated form of (3.6): uniformly for $y_{jn} \in I$ and z in compact subsets of \mathbb{C} ,

(4.7)
$$\lim_{n \to \infty} \frac{p'_n \left(y_{jn} + \frac{z}{n\omega(y_{jn})} \right)}{n\omega(y_{jn}) p_n(y_{jn})} = -\pi \sin \pi z.$$

Then noting that we can replace n by $n \pm 2$ in the term involving z, we see that

$$\frac{p_{n-2}(x_{jn})}{p_{n-2}(y_{j-1,n-2})} = \int_{(x_{j-1,n-2}-y_{j-1,n-2})n\omega(y_{j-1,n-2})}^{(x_{j-1,n-2}-y_{j-1,n-2})n\omega(y_{j-1,n-2})} \frac{p'_{n-2}(y_{j-1,n-2} + \frac{t}{n\omega(y_{j-1,n-2})})}{n\omega(y_{j-1,n-2})p_{n-2}(y_{j-1,n-2})} dt$$

$$= \int_{(x_{j-1,n-2}-y_{j-1,n-2})n\omega(y_{j-1,n-2})}^{(x_{j-1,n-2}-y_{j-1,n-2})n\omega(y_{j-1,n-2})} (-\pi \sin \pi t + o(1)) dt.$$

Here the lower limit of integration is

$$(x_{j-1,n-2} - y_{j-1,n-2}) n\omega (y_{j-1,n-2}) = \frac{1}{2} + o(1),$$

(by (3.1)), so we can continue the above as

$$\frac{p_{n-2}(x_{jn})}{p_{n-2}(y_{j-1,n-2})} = \int_0^{(x_{jn}-x_{j-1,n-2})n\omega(y_{j-1,n-2})} \left(-\pi \sin\left(\pi \left(t + \frac{1}{2}\right)\right) + o(1)\right) dt + o(\delta_{jn})$$

$$= \int_0^{(x_{jn}-x_{j-1,n-2})n\omega(y_{j-1,n-2})} \left(-\pi \cos \pi t + o(1)\right) dt + o(\delta_{jn})$$

$$= -\sin \pi \delta_{jn} + o(\delta_{jn}).$$

Here we are also using that $\omega\left(y_{j-1,n-2}\right)/\omega\left(x_{jn}\right) \to 1$ as $n \to \infty$ by continuity of ω in the interior of I. Next, from (b), $|\delta_{jn}| \leq 1 - \varepsilon$, so $|\sin \pi \delta_{jn}| \sim |\delta_{jn}|$ and we can continue this as

$$\frac{p_{n-2}(x_{jn})}{p_{n-2}(y_{j-1,n-2})} = -(\sin \pi \delta_{jn}) (1 + o(1)).$$

It is possible here that $\delta_{jn} = 0$, but in such a case both sides are 0. Combining this with (4.5), (4.6) and (3.11) gives uniformly in j and n, for $n \geq n_0$,

 $|x_{jn} - b_{n-1}| |p_{n-1}(y_{j,n-1})| \sim |p_{n-2}(y_{j-1,n-2})| |\sin \pi \delta_{jn}| \sim |p_{n-2}(y_{j-1,n-2})| |\delta_{jn}|$. Here by our local limits and (1.3),

$$|p_{n-1}(y_{j,n-1})| = ||p_{n-1}||_{L_{\infty}[x_{j+1,n-1},x_{j,n-1}]} \sim ||p_{n-2}||_{L_{\infty}[x_{jn} - \frac{A}{n},x_{jn} + \frac{A}{n}]}^{-1}.$$

A related assertion holds for $p_{n-2}(y_{j-1,n-2})$. We deduce that

$$|x_{jn} - b_{n-1}| \sim ||p_{n-2}||^2_{L_{\infty}[x_{jn} - \frac{A}{n}, x_{jn} + \frac{A}{n}]} |\delta_{jn}|.$$

Again if $x_{jn} = b_{n-1}$, $\delta_{jn} = 0$.

Proof that Theorem 1.2(a)⇔(c)

If first (1.6) holds, then $|\delta_{jn}| \ge C |x_{jn} - b_{n-1}|$ and (4.4) gives

$$C \left| \delta_{jn} \right| \ge \left\| p_{n-2} \right\|_{L_{\infty}\left[x_{jn} - \frac{A}{n}, x_{jn} + \frac{A}{n}\right]}^{2} \left| \delta_{jn} \right|,$$

which forces

$$||p_{n-2}||^2_{L_{\infty}\left[x_{jn}-\frac{A}{n},x_{jn}+\frac{A}{n}\right]} \le C_1,$$

uniformly in $x_{jn} \in I$, provided no $\delta_{jn} = 0$. Since $\delta_{jn} = 0$ can occur for at most one j, namely when $x_{jn} = b_{n-1}$ (as follows from the recurrence relation), that exceptional interval can be covered by others with A large enough. So we have (1.8).

Conversely, suppose we have (1.8). Then from (4.4),

$$|x_{jn} - b_{n-1}| \le C |\delta_{jn}|,$$

so that we have (1.6).

Proof that Theorem 1.2(b)⇔(c)

It is immediate that $(b)\Rightarrow(c)$. For the converse we note that if (c) holds, then from Theorem 1.1(c),

$$||p_{n-1}||_{L_{\infty}\left[x-\frac{A}{n},x+\frac{A}{n}\right]} \ge C$$

uniformly for $x \in I$. This together with (1.8), gives (1.7).
