## About Frontiers

Frontiers is more than just an open-access publisher of scholarly articles: it is a pioneering approach to the world of academia, radically improving the way scholarly research is managed. The grand vision of Frontiers is a world where all people have an equal opportunity to seek, share and generate knowledge. Frontiers provides immediate and permanent online open access to all its publications, but this alone is not enough to realize our grand goals.

## Frontiers Journal Series

The Frontiers Journal Series is a multi-tier and interdisciplinary set of open-access, online journals, promising a paradigm shift from the current review, selection and dissemination processes in academic publishing. All Frontiers journals are driven by researchers for researchers; therefore, they constitute a service to the scholarly community. At the same time, the Frontiers Journal Series operates on a revolutionary invention, the tiered publishing system, initially addressing specific communities of scholars, and gradually climbing up to broader public understanding, thus serving the interests of the lay society, too.

## Dedication to Quality

Each Frontiers article is a landmark of the highest quality, thanks to genuinely collaborative interactions between authors and review editors, who include some of the world's best academicians. Research must be certified by peers before entering a stream of knowledge that may eventually reach the public - and shape society; therefore, Frontiers only applies the most rigorous and unbiased reviews. Frontiers revolutionizes research publishing by freely delivering the most outstanding research, evaluated with no bias from both the academic and social point of view. By applying the most advanced information technologies, Frontiers is catapulting scholarly publishing into a new generation.

## What are Frontiers Research Topics?

Frontiers Research Topics are very popular trademarks of the Frontiers Journals Series: they are collections of at least ten articles, all centered on a particular subject. With their unique mix of varied contributions from Original Research to Review Articles, Frontiers Research Topics unify the most influential researchers, the latest key findings and historical advances in a hot research area! Find out more on how to host your own Frontiers Research Topic or contribute to one as an author by contacting the Frontiers Editorial Office: [frontiersin.org/about/contact](https://frontiersin.org/about/contact)

## Editorial on the Research Topic Quantum light for imaging, sensing and spectroscopy

The last two decades have witnessed an enormous progress in the development of novel ideas and technologies for sensing and imaging based on the quantum properties of light. Our ability to generate, manipulate and detect non-classical states of light has opened new avenues in experimental imaging, sensing and spectroscopy, where unprecedented levels of sensitivity and resolution can be attained. In this Research Topic, we aim at highlighting state-of-the-art research, and their potential applications, in imaging, spectroscopy and metrology. This includes the generation and control of quantum optical states, such as single-photon sources, entangled photon pairs, and structured light beams.

This Research Topic, issued within the Quantum Engineering and Technology section of Frontiers in Physics, includes one brief research report, eight original research articles, and one review article. These contributions cover applications of entangled light in metrology and spectroscopy, the generation of spatially-structured non-classical states of light, as well as imaging applications using correlated thermal light and machine learning.

Chen et al. provide a review article on both theoretical and experimental entangled-photon-enabled quantum interferometric metrology. Topics covered by the review include Hong-Ou-Mandel interferometry with frequency and time resolution, entanglement-assisted single-photon absorption and two-photon absorption spectroscopy using energy-time correlated photon pairs. Scully et al. introduce a spectroscopy technique based on the monitoring of quantum beats in the cooperative light emission from an atomic (or molecular) sample. The use of entangled photon pairs in the context of spectroscopy is discussed by Schlawin, who explores the possible role of

the sample's inhomogeneous broadening and photons' polarization degrees of freedom in the quantum enhancement that entangled two-photon absorption might offer to experimental nonlinear spectroscopy. [Debnath and Rubio](#) further show that entangled light can also be used as a probe for extracting information about dissipative cavity exciton-polariton dynamics in the ultrafast regime.

The generation and control of non-classical states of light are discussed in two contributions. [Puentes](#) discusses a method for the generation of entangled two-photon states in high-dimensional Hilbert spaces by placing multiple angular slits in the path of spontaneous parametric down-converted entangled photon pairs. This result can be relevant for quantum information protocols where high-dimensional encryption is required. [Mendoza-López et al.](#) demonstrate theoretically and experimentally the frequency conversion of multiple optical vortices by inducing a four-wave mixing process in a hot vapor of rubidium atoms. The authors' study adds to the available protocols for the generation and control of photonic orbital angular momentum in atomic ensembles.

The potential of structured light for quantum physics is discussed by [Gutiérrez-Jáuregui and Jáuregui](#) who show that nonlinear processes, at the single-photon level, might be produced in the light-matter interaction of tightly trapped atoms in the focus of vectorial waves. Furthermore, [Lv et al.](#) demonstrate that propagating spatially-structured modes of light can be identified (and reconstructed) using deep learning. This method is particularly relevant in quantum applications where structured light is susceptible to phase distortions due to propagation in noisy environments.

[Wang et al.](#) demonstrate a theoretical and experimental scheme for "fractional" ghost imaging. This is managed by symmetrically placing the object to be imaged and a fractional spiral phase filter in the test and reference pseudo-thermal beams of a lensless ghost imaging system. Finally, [Fernandez-Guasti and Garcia-Guerrero](#) demonstrate an interesting scheme that allows for two non-degenerate photon beams to exhibit first-order optical interference. These results call for a possible reformulation of the "which-way information" concept for non-degenerate photon interference.

To conclude, we would like to mention that the study of quantum light for imaging, sensing, and spectroscopy is a timely and exciting research field at the forefront of physics and technology. It has the potential to impact many areas of science and engineering, from material science to quantum communications and quantum computing. We expect this Research Topic to provide valuable information and guidance for future research along these lines.

Finally, we would like to thank all authors, reviewers and administrative staff at Frontiers, without whom this Research Topic could not have been possible.

## Author contributions

All authors have made a substantial, direct, and intellectual contribution to the editorial and approved it for publication.

## Acknowledgments

RJLM thankfully acknowledges financial support by DGAPA-UNAM under the project UNAM-PAPIIT IN102920. OSML acknowledges support from the [National Science Foundation through Grant No. OMA MPS—2231387](#).

## Conflict of interest

The authors declare that the research was conducted in the absence of any commercial or financial relationships that could be construed as a potential conflict of interest.
